**Задача №4.** Вариант 8 Зубарева Наталия БПИ195 Файлы «youtube\_1.csv» ... «youtube\_10.csv» содержат следующие сведения о видеороликах на YouTube (по сто роликов на каждый вариант):

на YouTube (по сто роликов на каждый вариант):

n — номер наблюдения,
id — идентификатор ролика,
framerate — число кадров в секунду,
frames — общее число кадров в видео,
bitrate — битрейт, Кбит/сек.
duration — продолжительность, сек.

size — размер видеофайла, байт.

Для признаков **framerate**, **frames**, **bitrate**, **duration** и **size** рассчитайте две корреляционные матрицы — на основании коэффициентов Пирсона и Спирмена. Оцените значимость каждого коэффициента (проверьте гипотезу об отсутствии корреляции) и представьте полученные результаты в виде таблицы:

Коэффициенты корреляции Пирсона. framerate frames bitrate duration size framerate 1.00 0.08 -0.020.04 0.02 0.08 0.120.45\*\*0.29\*frames 1.00 bitrate -0.020.12 1.00 -0.030.72\*\*\*

-0.03

0.72\*\*\*

1.00

0.36\*\*

0.36\*\*

1.00

0.45\*\*

0.29\*

\* — коэффициент значим на уровне 5%,

size

\*\* — коэффициент значим на уровне 1%,

\*\*\* — коэффициент значим на уровне 0.1%.

duration

0.04

0.02

Коэффициенты, не отмеченные звёздочками, незначимы (нет оснований отвергнуть гипотезу об отсутствии корреляции на уровне 5%).

Сравните коэффициенты Пирсона и Спирмена, обратите внимание на случаи, когда два этих коэффициента существенно расходятся, если такие есть. Что такое «существенно», решайте сами. В случае существенного расхождения постройте диаграммы разброса для тех пар признаков, тесноту связи между которыми коэффициенты измеряют по-разному, и попытайтесь объяснить причину расхождения.

Если вы не видите никаких существенных расхождений между двумя матрицами, просто постройте диаграмму рассеяния для случая, где разность коэффициентов Пирсона и Спирмена наибольшая.

Сначала считаем данные из файла csv. Matlab делает это с разделением данных на 2 массива: textdata и data, в первом находятся заголовки столбцов, id и названия видео, которые нам в принципе не нужны, во втором - столбцы значений framerate, frames, bitrate, duration и size, выделим их в отдельные массивы

// uucu = Imp	or cuaca ( your abe_oresv , ,	,1/				
2.0	data: [100×5 double]					
data = t	textdata: {101×7 cell}

## Теперь сравним то, что мы получили Для каждой пары соответствующих коэффициентов Пирсона и Спирмена

модуль их разности (это кажется довольно осознанным способом сравнивать). Будем считать, что разница существенная, если она превосходит 50% Процент, который составляет модуль разности коэффициентов Пирсона и Спирмена от коэффициента Пирсона:

найдём, какой процент от соответствующего коэффициента Пирсона составляет

	framerate	frames	bitrate	duration	size
framerate	0	2.9386	62.6825	215.6028	96.2730
frames	2.9386	0	288.8	2.3956	6.9122
bitrate	62.6825	288.8	0	40.2145	81.8242
duration	215.6028	2.3956	40.2145	0	8.991
size	96.2730	6.9122	81.8242	8.991	0

framerate to bitrate 6 0 5

Теперь построим диаграммы разброса для этих пар:

8 fram@rate 30 35

3

2

1

Так как коэффициент Пирсона измеряет монотонную линейную связь, он меньше коэффициента Спирмена (измеряющего монотонную связь) для выборок на графике - как можно видеть, framerate достаточно дискретный, поэтому линейность не получается. В этом случае коэффициент Спирмена должен быть больше (что мы и наблюдаем)

На этих графиках мы видим, что точки распределяются по радиальным линиям, и глобально это не линейная связь, поэтому коэффициент Пирсона ее не учитывает, однако коэффициент Спирмена учитывает такую связь тоже, поэтому он в несколько раз больше.

В целом можно сказать, что коэффициент Спирмена благодаря работе с рангами учитывает большее разнообразие нелинейных связей между выборками, поэтому он может существенно отличаться от коэффициента Пирсона для выборок с нелинейной связью.
